

### Filling Graphical Shapes

- Know how to draw outlines
  - Polygons, circles, ellipses, etc.
- What if we want to fill them?

The diagram illustrates the concept of filling shapes. On the left, three shapes are shown as outlines: a white rectangle, a white ellipse, and a red jagged polygon. On the right, the same three shapes are shown filled: a green rectangle, a blue ellipse, and a blue jagged polygon. A small number '1' is in the bottom right corner of the slide.

---

### Calculating Fill Areas

- Fill one scan line at a time
  - Odd/even rule
- Need intersection points
  - Use pixels directly?
    - In a buffer? On screen (GetPixel)?
  - Calculate intersections from polygon edge equations?

The diagram shows a grid of pixels with a scan line passing through a polygon. The pixels are colored cyan, yellow, and blue. The scan line is a horizontal line passing through the grid. A small number '2' is in the bottom right corner of the slide.

---

---

---

---

---

---

---

---

### Scan-Line Polygon Fill

The diagram shows a grid of pixels with a scan line passing through a polygon. The pixels are colored cyan, yellow, and blue. The scan line is a horizontal line passing through the grid. A small number '3' is in the bottom right corner of the slide.

---

---

---

### A Filling Anomaly?

4

---

---

---

---

---

---

---

---

### Inside-Outside Tests

- Odd-even rule
  - Generalized from scan-line fill
  - May produce unusual results if edges intersect
- Nonzero winding number rule
  - Alternate way of determining interior

5

---

---

---

---

---

---

---

---

### Odd-Even Rule

- Choose a point
- Draw ray to a distant point
  - Don't intersect any vertices
- Count edges crossed
  - Odd count means interior
  - Even count means exterior
- Same idea as scan-line even/odd

6

---

---

---

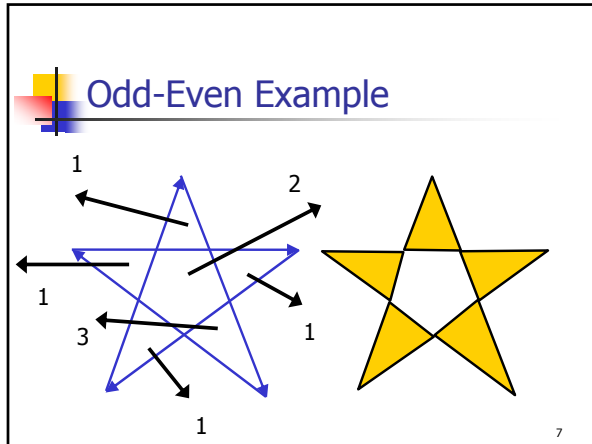

---

---

---

---

---

---

---

---

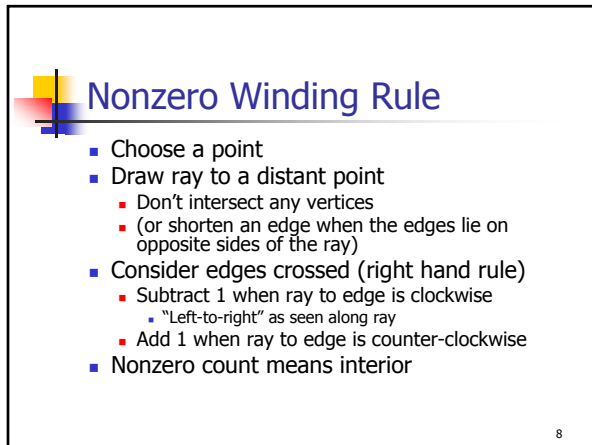

---

---

---

---

---

---

---

---

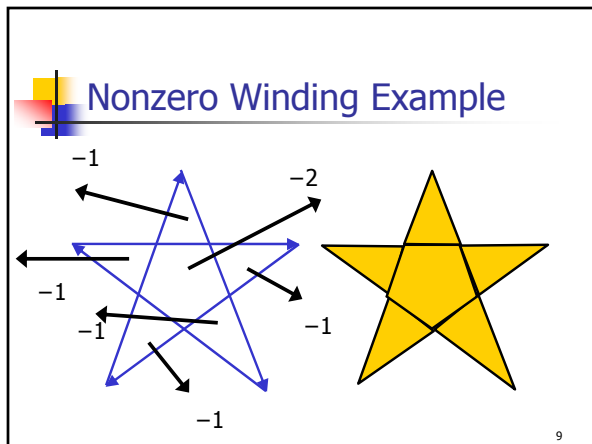

---

---

### Computing Winding Number

- Edge crossing direction
- Compute cross product
  - Between ray and edge
  - Sign of z value determines direction
- Compute dot product
  - Use perpendicular to ray vs. edge
  - Sign of product determines direction

---

---

### Cross Product Example

$$\begin{aligned}
 u \times E &= (u_y E_z - u_z E_y, u_z E_x - u_x E_z, u_x E_y - u_y E_x) \\
 &= (1 \cdot 0 - 0 \cdot 0, 0 \cdot 1 - 1 \cdot 0, 1 \cdot 0 - 1 \cdot 1) \\
 &= (0, 0, -1)
 \end{aligned}$$

"−1" means E crosses P from left to right

$E = V_B - V_A$   
 $= (1, 0, 0)$

$V_A=(1,0,0)$     $V_B=(2,0,0)$

$u=(1,1,0)$

11

---

---

---

---

---

---

---

---

### Cross Product Simplification

$$\begin{aligned}
 u \times E &= (u_y E_z - u_z E_y, u_z E_x - u_x E_z, u_x E_y - u_y E_x) \\
 &= (u_y \cdot 0 - 0 \cdot E_y, 0 \cdot E_x - u_x \cdot 0, u_x E_y - u_y E_x) \\
 &= (0, 0, u_x E_y - u_y E_x)
 \end{aligned}$$

negative means E crosses P from left to right

12

---

---

---

---

---

---

---

---

### Dot Product Example

$$\begin{aligned}
 w \cdot E &= w_x E_x + w_y E_y + w_z E_z \\
 &= -1 \cdot 1 + 1 \cdot 0 + 0 \cdot 0 \\
 &= -1
 \end{aligned}$$

Again, "-1" means E crosses P from left to right

$V_A=(1,0,0)$   $V_B=(2,0,0)$   
 $u=(1,1,0)$ ,  $w = (-1,1,0)$  ["right-to-left" perpendicular to  $u$ ]

---

---

---

---

---

---

---

---

### Dot Product Simplification

$$\begin{aligned}
 w &= u_{\perp} \\
 m_{\perp} &= -\frac{\Delta x}{\Delta y} \\
 w \cdot E &= u_{\perp} \cdot E \\
 &= (-u_y, u_x, 0) \cdot (E_x, E_y, E_z) \\
 &= u_x E_y - u_y E_x
 \end{aligned}$$

Same result as from cross product!

---

---

---

---

---

---

---

---

### What Does Fill Mode Mean?

- Mathematical definition
  - Ray / edge crossings
- Odd/even (alternating)
  - Overlapping parts not filled
- Nonzero winding
  - Overlapping parts are filled

---

---

---

---

---

---

---

---

### Filling a Polygon (Qt) (1)

```

QCanvasPolygon
  inherits QCanvasPolygonalItem
  inherits QCanvasItem
  inherits Qt (namespace for enums)

QCanvasPolygon::setPoints(
  QPointArray pa)
QCanvasPolygonalItem::setBrush(
  Qbrush b)
QCanvasPolygonalItem::setWinding(
  bool enable) // protected
  
```

16

---

---

---

---

---

---

---

---

### Filling a Polygon (Qt) (2)

```

class myPolygon : public QCanvasPolygon
{
  myPolygon();
  ...
};

myPolygon::myPolygon()
{
  setBrush(QBrush(green,
    DiagCrossPattern));
  setWinding(true);
  ...
}
  
```

17

---

---

---

---

---

---

---

---

### Filling a Polygon (MS Windows)

```

BOOL CDC::Polygon
(LPPOINT points,
 int count);

int CDC::SetPolyFillMode
(int mode);
  
```

ALTERNATE WINDING
